Model Comparison Report

Target: classify users into Low / Medium / High behavioral segments.
Models evaluated: baseline most-frequent, Logistic Regression, Gaussian Naive Bayes, and Random Forest.
Best overall model on the 5-cohort rebuild: LogisticRegression.
Best parameters: {"classifier__C": 0.1, "classifier__class_weight": "balanced"}.
Test accuracy: 1.000.
Test macro F1: 1.000.
IDs are namespaced by cohort so generic user labels reused by different groups are not merged incorrectly.
Caution: 30 of the 50 participant demographic profiles are generated placeholders because only two real demographic workbooks are present.
